Highlights

 Non-Gaussian stochastic fields are proposed that can be suitable for modeling environmental data.

 the right hand side represents the biased sampling distribution when sampling is made over the 0-level contour C₀ = {τ : X(τ) = 0}

Are Gaussian models good?

◆□▶ ◆□▶ ◆三▶ ◆三▶ ●□ ● ●

Are Gaussian models good?

They are good!

- Spectral theory or frequency domain analysis is at the center of stochastic modeling in engineering sciences
- Elegant mathematical properties, for which the relation between the frequency and time domain is well understood
- The ability to model spatio-temporal phenomena through essentially the same framework as for time only dependent data contributed the popularity in geostatistics

Are Gaussian models good enough?

Are Gaussian models good enough?

- Empirical evidence that the Gaussian models often do not fit properly the phenomena they are intended to describe
- Discrepancies amplified additionally by non-linearity of deterministic physical models behind the data
- Asymmetry and heavy tails features that cannot be modeled by Gaussian distributions
- Examples: skewness of sea levels data (Åberg (2007)), highly skewed measuremnts of soil properties in geotechnical engineering problems and seismic ground motion (Lagaros et al. (2005)), heavier than Gaussian tails were reported from such spatial phenomena as topographic data, temperature (Palacios and Steel (2006)), or well log data in petroleum application (Røislien and Omre (2006)), Gurley et al. (1996) – critical discussion of various approaches to handling the non-Gaussian loads

What are alternatives?

▲□▶▲□▶▲目▶▲目▶ 目 のへで

What are alternatives?

 Growing interest in the stochastic models that serve as asymmetric and heavier-tailed alternatives to the Gaussian processes

What are alternatives?

- Growing interest in the stochastic models that serve as asymmetric and heavier-tailed alternatives to the Gaussian processes
- Considerable efforts have been put toward searching such alternatives

What are alternatives?

- Growing interest in the stochastic models that serve as asymmetric and heavier-tailed alternatives to the Gaussian processes
- Considerable efforts have been put toward searching such alternatives
- Examples here are stable and related infinitely divisible processes

What are alternatives?

- Growing interest in the stochastic models that serve as asymmetric and heavier-tailed alternatives to the Gaussian processes
- Considerable efforts have been put toward searching such alternatives
- Examples here are stable and related infinitely divisible processes
- Non-existence of finite second moments is difficult to adopt in an engineering context where the spectral theory and the frequency domain is a dominating tool for data analysis

Gaussian process - spectral representation

Gaussian process - spectral representation

Any Gaussian process can be written as

$$\begin{aligned} \mathsf{X}(t) &= \int \exp(it\lambda) \,\zeta(\lambda) \\ &= \int_0^\infty \cos(\lambda t) \,d\mathsf{B}_{\mathsf{F}}(\lambda) + \int_0^\infty \sin(\lambda t) \,d\tilde{\mathsf{B}}_{\mathsf{F}}(\lambda) \end{aligned}$$

where *F* is a non-decreasing function.

Gaussian process - spectral representation

Any Gaussian process can be written as

$$\begin{aligned} \mathsf{X}(t) &= \int \exp(it\lambda) \,\zeta(\lambda) \\ &= \int_0^\infty \cos(\lambda t) \,d\mathsf{B}_{\mathsf{F}}(\lambda) + \int_0^\infty \sin(\lambda t) \,d\tilde{\mathsf{B}}_{\mathsf{F}}(\lambda) \end{aligned}$$

where F is a non-decreasing function.

• In discretization •, this leads to $\sigma^2(\lambda_j) = F(\lambda_j + d\lambda_j) - F(\lambda_j).$

Bad or good news?

 In fact, it has been shown that any second order harmonizable non-Gaussian process can not be ergodic – Wright (1978)

Bad or good news?

- In fact, it has been shown that any second order harmonizable non-Gaussian process can not be ergodic – Wright (1978)
- That maybe not such a bad news as long as invariant sets for the process will be identified

Bad or good news?

- In fact, it has been shown that any second order harmonizable non-Gaussian process can not be ergodic – Wright (1978)
- That maybe not such a bad news as long as invariant sets for the process will be identified
- Non-ergodic models can be used for modeling phenomena that vary from sample to sample

Bad or good news?

- In fact, it has been shown that any second order harmonizable non-Gaussian process can not be ergodic – Wright (1978)
- That maybe not such a bad news as long as invariant sets for the process will be identified
- Non-ergodic models can be used for modeling phenomena that vary from sample to sample
- Finally non-ergodicity in space can be mixed in time and in spatio-temporal models sample distribution collected over time maybe still converging to constant values

- explicit formulas for the moments, skeweness and kurtosis
- large α, the kernel is more like the one for the generalized Laplace, i.e. approximately constant on the compact support, while for small α it correspond more to averaging that leads to Gaussian-like distributions

Laplace integrals – densities

Figure: Examples of densities and their dependence on the parameters. In the top row we see symmetric densities with $\alpha = 0.5, 1, 2, 20$ on each graph. From left to right $\nu = 0.5, 1, 2$, respectively. The top rows deals with the symmetric case ($\mu = 0$) while the bottom one with the asymmetric one in which the asymmetry parametry parameter $\mu = \sqrt{\rho * \nu}$, with p = 0.1.

Laplace moving averages

• By the means of stochastic integral we define

$$X_t = \int_{\mathcal{X}} f(t-x) d\Lambda(x).$$

• the kernel f can be estimated from the spectrum

Laplace moving averages

• By the means of stochastic integral we define

$$X_t = \int_{\mathcal{X}} f(t-x) d\Lambda(x).$$

- the kernel f can be estimated from the spectrum
- the parameters of the Laplace motion can be fitted using method of moments

Laplace moving averages

• By the means of stochastic integral we define

$$X_t = \int_{\mathcal{X}} f(t-x) d\Lambda(x).$$

- the kernel f can be estimated from the spectrum
- the parameters of the Laplace motion can be fitted using method of moments
- if the kernel is assumed from a parametric family one can use fit the parameters using correlation function

Laplace moving averages

• By the means of stochastic integral we define

$$X_t = \int_{\mathcal{X}} f(t-x) d\Lambda(x).$$

- the kernel f can be estimated from the spectrum
- the parameters of the Laplace motion can be fitted using method of moments
- if the kernel is assumed from a parametric family one can use fit the parameters using correlation function
- a non-parametric approach an estimate \hat{f} is given by

$$\widehat{f}(\boldsymbol{x}) = \mathcal{F}^{-1}\sqrt{\widehat{R}(\omega)},$$

where $\widehat{R}(\omega)$ is an estimate of spectrum

Ergodicity

Rice formula and sampling distribution

• The joint distribution of X(0) and X'(0)

$$\phi_{X(0),X'(0)}(\xi_1,\xi_2) = \exp\left(-\int_0^\infty \ln\left(1+\frac{1}{2}(\xi_1^2+\xi_2^2\lambda^2)\right) \, dF(\lambda)\right).$$

Rice formula and sampling distribution

• The joint distribution of X(0) and X'(0)

$$\phi_{X(0),X'(0)}(\xi_1,\xi_2) = \exp\left(-\int_0^\infty \ln\left(1+\frac{1}{2}(\xi_1^2+\xi_2^2\lambda^2)\right) \, dF(\lambda)\right).$$

 the process and its derivative at a fixed point are uncorrelated but not independent as it is in a Gaussian case

Rice formula and sampling distribution

• The joint distribution of X(0) and X'(0)

$$\phi_{X(0),X'(0)}(\xi_1,\xi_2) = \exp\left(-\int_0^\infty \ln\left(1+\frac{1}{2}(\xi_1^2+\xi_2^2\lambda^2)\right) \, dF(\lambda)\right).$$

- the process and its derivative at a fixed point are uncorrelated but not independent as it is in a Gaussian case
- by inverse Fourier transform

$$f_{X(0),X'(0)}(u,z) = \frac{1}{(2\pi)^2} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} e^{-i(\xi_1 u + \xi_2 z)} \phi_{X(0),X'(0)}(\xi_1,\xi_2) \, d\xi_1 \, d\xi_2.$$

Rice formula and sampling distribution

• The joint distribution of X(0) and X'(0)

$$\phi_{X(0),X'(0)}(\xi_1,\xi_2) = \exp\left(-\int_0^\infty \ln\left(1+\frac{1}{2}(\xi_1^2+\xi_2^2\lambda^2)\right) \, dF(\lambda)\right).$$

- the process and its derivative at a fixed point are uncorrelated but not independent as it is in a Gaussian case
- by inverse Fourier transform

$$f_{X(0),X'(0)}(u,z) = \frac{1}{(2\pi)^2} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} e^{-i(\xi_1 u + \xi_2 z)} \phi_{X(0),X'(0)}(\xi_1,\xi_2) \, d\xi_1 \, d\xi_2.$$

the crossing intensity can be computed by the integral

$$\mu^{+}(u) = \frac{1}{(2\pi)^{2}} \int_{0}^{\infty} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} z e^{-i(\xi_{1}u + \xi_{2}z)} \phi_{X(0),X'(0)}(\xi_{1},\xi_{2}) d\xi_{1} d\xi_{2} dz.$$

Conclusions

 The Laplace stochastic integral based models extends beyond Gaussian by modelling asymmetry and heavy tails

- The Laplace stochastic integral based models extends beyond Gaussian by modelling asymmetry and heavy tails
- Much of the second order theory remains valid

- The Laplace stochastic integral based models extends beyond Gaussian by modelling asymmetry and heavy tails
- Much of the second order theory remains valid
- Conceptually spatio-temporal models are not much more complex

・ロト・日本・日本・日本・日本

- The Laplace stochastic integral based models extends beyond Gaussian by modelling asymmetry and heavy tails
- Much of the second order theory remains valid
- Conceptually spatio-temporal models are not much more complex
- Sampling properties may differ process at high level crossings, asymmetric kernels
