## EQUILIBRIUM EQUATIONS

We give some hints on how to set up mathematical equations for chemical equilibrium problems.
0.1. Chemical equilibrium. Consider an elementary reaction of the form

$$
\begin{equation*}
\mathrm{AB} \underset{k_{12}}{\stackrel{k_{11}}{\rightleftharpoons}} \mathrm{~A}+\mathrm{B} \tag{1}
\end{equation*}
$$

Chemical equilibrium means that the rates of formation of the substances are zero:

$$
0=\frac{d}{d t}[\mathrm{AB}]=-\frac{d}{d t}[\mathrm{~A}]=-\frac{d}{d t}[\mathrm{~B}]=-k_{11}[\mathrm{AB}]+k_{12}[\mathrm{~A}][\mathrm{B}]
$$

so that

$$
\begin{equation*}
\frac{[\mathrm{A}][\mathrm{B}]}{[\mathrm{AB}]}=K \tag{2}
\end{equation*}
$$

where the equilibrium constant is $K=\frac{k_{11}}{k_{12}}$, measured in the unit $\mathrm{M}=$ molar $=\mathrm{mol} / \mathrm{L}$. In order to use Newton's method we write the equation in the form

$$
K x_{1}-x_{2} x_{3}=0
$$

or

$$
x_{1}-x_{2} x_{3} / K=0
$$

where $x_{1}=[\mathrm{AB}], x_{2}=[\mathrm{A}], x_{3}=[\mathrm{B}]$.

### 0.2. Solubility product.

$$
\begin{equation*}
\mathrm{AB}(\mathrm{~s}) \stackrel{k_{11}}{\underset{k_{12}}{\rightleftharpoons}} \mathrm{~A}(\mathrm{aq})+\mathrm{B}(\mathrm{aq}) \tag{3}
\end{equation*}
$$

Here we cannot speak of the concentration of the solid AB and instead of (2) we have

$$
[\mathrm{A}][\mathrm{B}]=K_{\mathrm{sp}}
$$

where $K_{\mathrm{sp}}$ is the solubility product with unit $\mathrm{M}^{2}$. This leads to the equation

$$
K_{\mathrm{sp}}-x_{2} x_{3}=0
$$

or

$$
1-x_{2} x_{3} / K_{\mathrm{sp}}=0
$$

0.3. Mass balance. We need more equations. One possibility is to note that in (1) or (3) we must have

$$
V([\mathrm{AB}]+[\mathrm{A}])=\mathrm{A}_{\mathrm{tot}}
$$

where $V$ is the volume and $\mathrm{A}_{\text {tot }}$ is the total amount of $A(\mathrm{~mol})$ which may be known from the preparation of the experiment. If there are more reactions, and A appears in other forms, then the corresponding terms must be added into the mass balance.
0.4. Charge balance. Further equations may be obtained by counting the charges of the ions. For example, if AB is neutral and A positive and B negative, then

$$
[\mathrm{A}]-[\mathrm{B}]=0
$$

means that the solution is electrically neutral. If there are more reactions and other ions then more terms must be added in the charge balance equation.
