

Statistical Image Analysis

Lecture 3: Kriging and parameter estimation

David Bolin
University of Gothenburg

Gothenburg
April 9, 2018

- A random field $X(\mathbf{s})$ is Gaussian if $(X(\mathbf{s}_1), \dots, X(\mathbf{s}_n))^T$ has a multivariate Gaussian distribution for each choice of $\mathbf{s}_1, \dots, \mathbf{s}_n$.
- $X(\mathbf{s})$ is uniquely specified by
 - ① The mean value function $\mu(\mathbf{s}) = E(X(\mathbf{s}))$, and
 - ② The covariance function $r(\mathbf{s}_1, \mathbf{s}_2) = C(X(\mathbf{s}_1), X(\mathbf{s}_2))$.
- $X(\mathbf{s})$ is
 - ① **stationary** if $\mu(\mathbf{s}) \equiv \mu$ and if $r(\mathbf{s}_1, \mathbf{s}_2)$ depends only on the separation between the locations, $\mathbf{h} = \mathbf{s}_1 - \mathbf{s}_2$.
 - ② **isotropic** if $\mu(\mathbf{s}) \equiv \mu$ and if $r(\mathbf{s}_1, \mathbf{s}_2)$ only depends on the distance between the locations, $h = \|\mathbf{s}_1 - \mathbf{s}_2\|$.
- Examples of isotropic covariance functions:
 - ① Matérn: $r(h) = \frac{\sigma^2}{\Gamma(\nu)} h^{2\nu-1} (\kappa h)^\nu K_\nu(\kappa h)$
 - ② Exponential: $r(h) = \sigma^2 \exp(-\kappa h)$
 - ③ Spherical: $r(h) = \sigma^2 (1 - \frac{3}{2} \frac{h}{\theta} + \frac{1}{2} \frac{h^3}{\theta^3})$, if $h \leq \theta$ and $r(h) = 0$ otherwise.

- We have measurements y_1, \dots, y_n taken at some spatial locations $\mathbf{s}_1, \dots, \mathbf{s}_n$.
- Given that we also have some explanatory variables B_1, \dots, B_K , we use a model

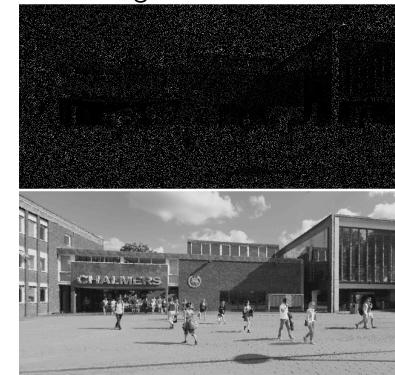

$$Y_i = \sum_{k=1}^K B_k(\mathbf{s}_i) \beta_k + X(\mathbf{s}_i) + \varepsilon_i.$$

where $X(\mathbf{s})$ is a mean-zero Gaussian random field.

- Questions:

- ① How do we estimate the parameters of the model?
- ② How can we perform prediction for an unobserved location \mathbf{s}_0 ?

Image reconstruction

Noise reduction

For a multivariate Gaussian variable

$$\begin{pmatrix} \mathbf{X}_1 \\ \mathbf{X}_2 \end{pmatrix} \sim N \left(\begin{pmatrix} \boldsymbol{\mu}_1 \\ \boldsymbol{\mu}_2 \end{pmatrix}, \begin{pmatrix} \boldsymbol{\Sigma}_{11} & \boldsymbol{\Sigma}_{12} \\ \boldsymbol{\Sigma}_{21} & \boldsymbol{\Sigma}_{22} \end{pmatrix} \right)$$

we have that

$$\mathbf{X}_2 | \mathbf{X}_1 \sim N(\boldsymbol{\mu}_2 + \boldsymbol{\Sigma}_{21}\boldsymbol{\Sigma}_{11}^{-1}(\mathbf{X}_1 - \boldsymbol{\mu}_1), \boldsymbol{\Sigma}_{22} - \boldsymbol{\Sigma}_{21}\boldsymbol{\Sigma}_{11}^{-1}\boldsymbol{\Sigma}_{12})$$

If \mathbf{X}_2 represents a random field at some unobserved locations, and \mathbf{X}_1 the observations, the conditional mean

$$E(\mathbf{X}_2 | \mathbf{X}_1) = \boldsymbol{\mu}_2 + \boldsymbol{\Sigma}_{21}\boldsymbol{\Sigma}_{11}^{-1}(\mathbf{X}_1 - \boldsymbol{\mu}_1)$$

is often called the Kriging predictor.

Traditionally, one has separated between three cases

- Simple kriging: $\mu(\mathbf{s}) = \mathbf{B}(\mathbf{s})\boldsymbol{\beta}$ is known.
- Ordinary kriging: $\mu(\mathbf{s}) = \beta$ is unknown but constant.
- Universal kriging: $\mu(\mathbf{s}) = \mathbf{B}(\mathbf{s})\boldsymbol{\beta}$ is unknown.

For ordinary and universal kriging, we have to estimate the mean-value together with the covariance parameters $\boldsymbol{\theta}$ before computing the prediction.

So we have to

- Estimate the model parameters $\{\boldsymbol{\beta}, \sigma_e^2, \boldsymbol{\theta}\}$.
- Given the parameters, compute the kriging prediction.

- In geostatistics, it is common do describe random fields in terms of semivariograms instead of covariance functions.
- For a random field $X(\mathbf{s})$, the semivariogram is defined as

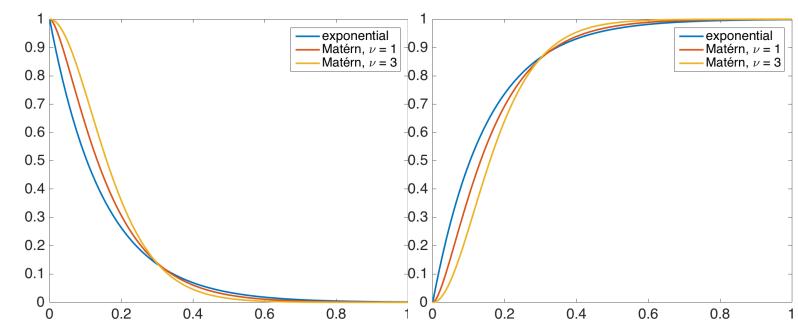

$$\gamma(\mathbf{s}, \mathbf{t}) = \frac{1}{2}V(X(\mathbf{s}) - X(\mathbf{t}))$$

and the variogram is $V(X(\mathbf{s}) - X(\mathbf{t}))$.

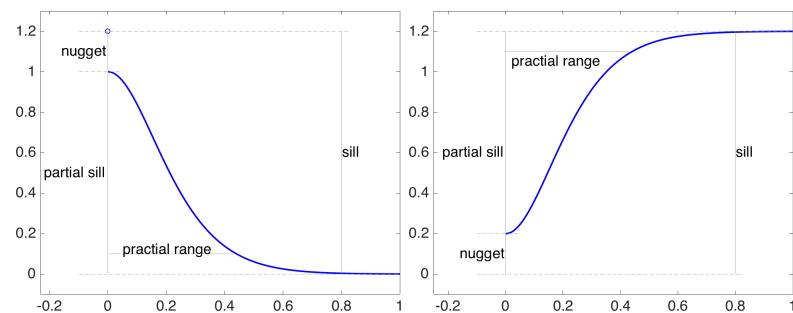

- For an isotropic random field with covariance $r(h)$, the semivariogram is

$$\gamma(h) = r(0) - r(h)$$

(exersice!)

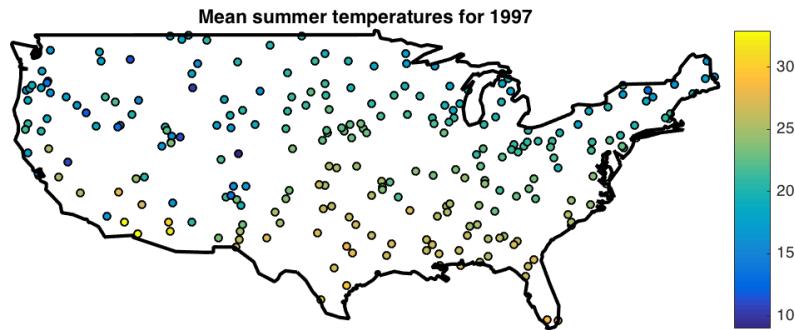

Some terminology

The classical Geostatistical approach

David Bolin

Example: US temperatures

- Mean summer temperatures (June-August) in the continental US 1997 recorded at 250 weather stations.
- We want to estimate all US temperatures based on the data.

Example

David Bolin

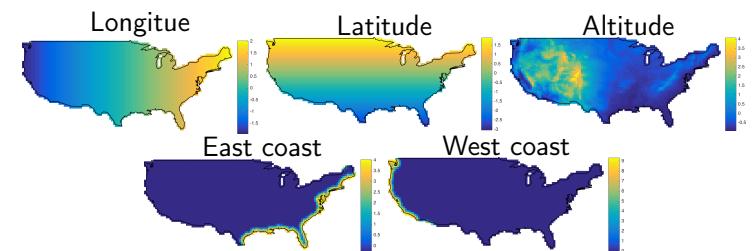

The classical Geostatistical approach

Covariates

- A first idea is to use linear regression to interpolate the data:

$$Y(\mathbf{s}) = \sum_{i=1}^k \beta_i B_i(\mathbf{s}) + \varepsilon_{\mathbf{s}}, \quad \text{where } \varepsilon_{\mathbf{s}} \text{ are iid } N(0, \sigma^2)$$

- Possible covariates

Example

David Bolin

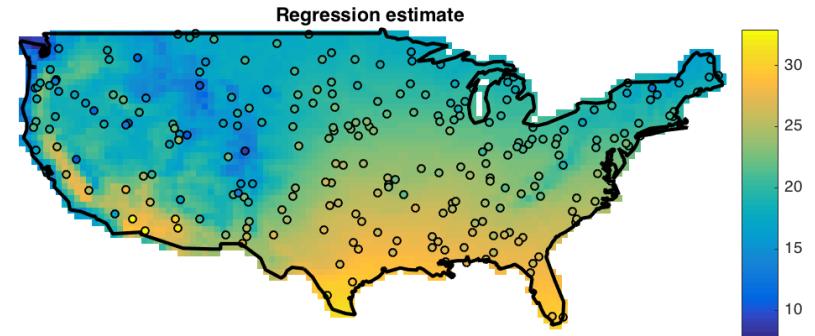

OLS estimate

- Estimate the parameters using ordinary least squares:

$$\hat{\boldsymbol{\beta}} = (\mathbf{B}^T \mathbf{B})^{-1} \mathbf{B}^T \mathbf{Y},$$

where $\mathbf{B}_{ij} = B_i(\mathbf{s}_j)$ and $\mathbf{Y}_i = Y(\mathbf{s}_i)$.

- Calculate the prediction $\hat{X}(\mathbf{s}) = \sum_{i=1}^k \hat{\beta}_i B_i(\mathbf{s})$.

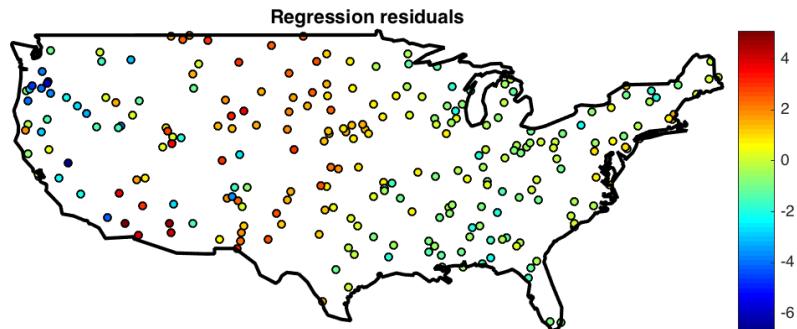

Example

David Bolin

Residuals

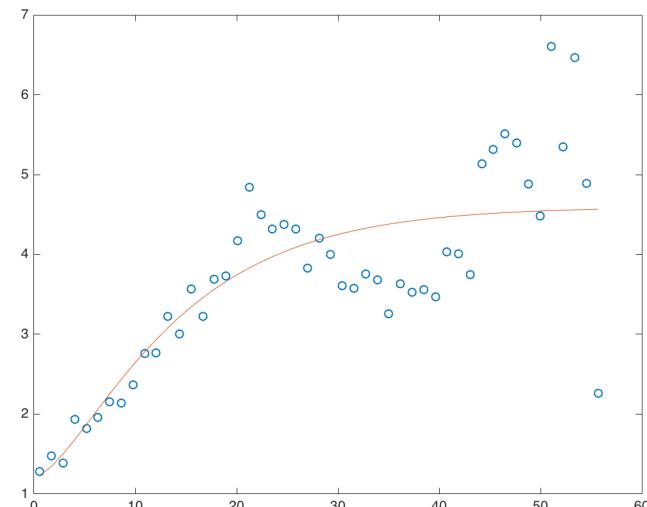

- How do we test whether the prediction is reasonable?
- If the model assumptions hold, the residuals $\mathbf{Y}(\mathbf{s}) - \hat{\mathbf{X}}(\mathbf{s})$ should be independent identically distributed.

Example

David Bolin

Variogram estimate

Example

David Bolin

Regression parameters

Update regression parameters using GLS:

$$\hat{\boldsymbol{\beta}}_{GLS} = (\mathbf{B}^\top \boldsymbol{\Sigma}^{-1} \mathbf{B})^{-1} \mathbf{B}^\top \boldsymbol{\Sigma}^{-1} \mathbf{Y},$$

Confidence interval for β_i :

$$I_{\beta_i} = (\hat{\beta}_i \pm 1.96 \sqrt{V_{ii}})$$

where $\mathbf{V} = (\mathbf{B}^\top \boldsymbol{\Sigma}^{-1} \mathbf{B})^{-1}$.

	OLS	GLS
Intercept	21.6317*	20.4688*
Longitude	-1.2897*	-1.0022
Latitude	-2.6959*	-2.6845*
Altitude	-2.6693*	-4.2177*
East coast	-0.0952	-0.0096
West coast	-1.3064*	-1.0139*

Example

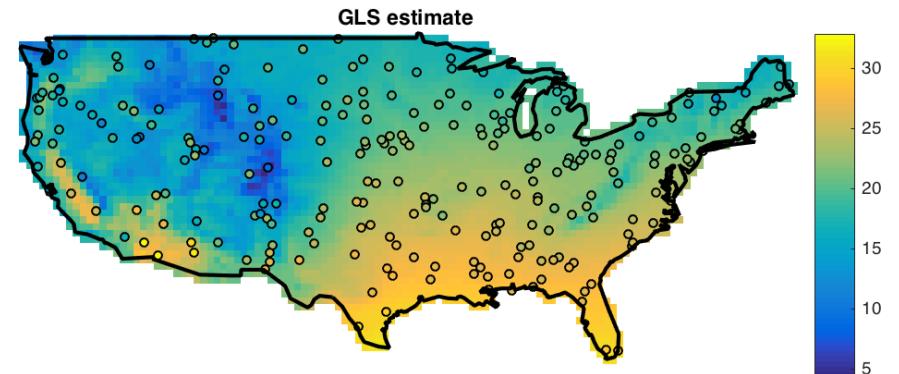

David Bolin

Kriging estimation

The kriging estimator is

$$\mathbb{E}(X(\mathbf{s})|\mathbf{Y}, \hat{\boldsymbol{\theta}}) = \hat{\mu}(\mathbf{s}) + \mathbf{r}(\boldsymbol{\Sigma} + \sigma_e^2 \mathbf{I})^{-1} (\mathbf{Y} - \mathbf{B}\hat{\boldsymbol{\beta}})$$

where $\boldsymbol{\Sigma}_{ij} = r(\mathbf{s}_i, \mathbf{s}_j)$, $\mathbf{r}_i = r(\mathbf{s}, \mathbf{s}_i)$, and $\hat{\boldsymbol{\mu}} = \sum_{k=1}^K B_k(\mathbf{s}) \hat{\beta}_k$.

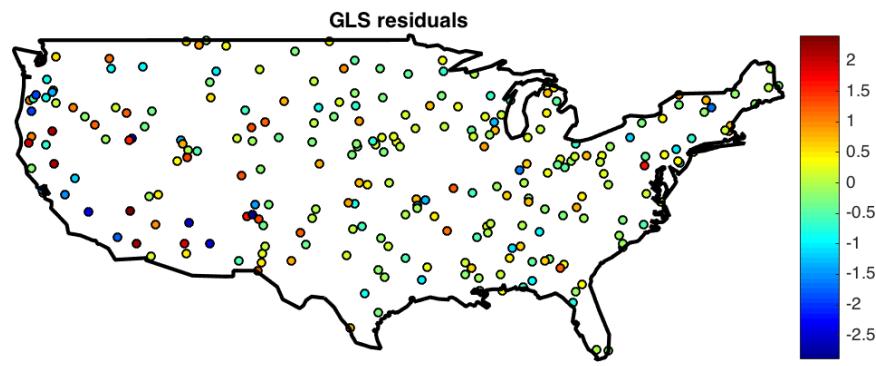

Example

David Bolin

Kriging residuals

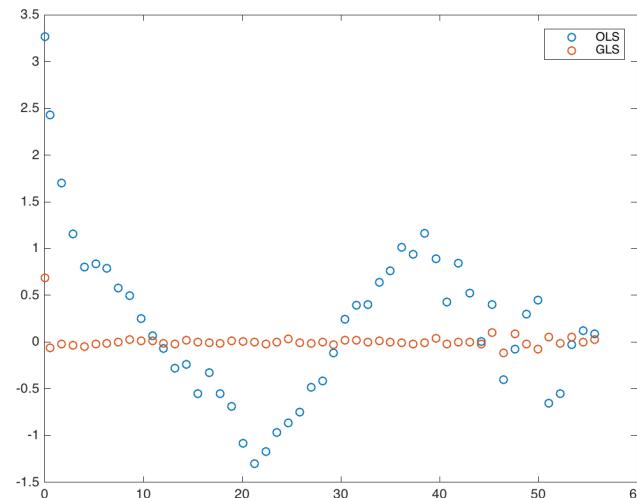

There is now less spatial structure in the residuals.
