Adaptive Variational Multiscale Methods

•

Axel Målqvist

axel@math.colostate.edu

Department of Mathematics, Colorado State University

Main results of the thesis

- A new adaptive variational multiscale method based on energy norm error estimation.
- An extension of the adaptive variational multiscale method to a mixed setting.
- Framework for adaptivity in multi-physics.

The new multiscale method

Model problem: The Poisson equations with coefficient a > 0,

$$-\nabla \cdot a \nabla u = f \quad \text{in } \Omega,$$
$$u = 0 \quad \text{on } \Gamma.$$

Weak form: Find $u \in V = H_0^1(\Omega)$ such that,

$$a(u,v) = l(v)$$
 for all $v \in H_0^1(\Omega)$,

where $a(v, w) = \int_{\Omega} a \nabla v \cdot \nabla w \, dx$, $l(v) = \int_{\Omega} f v \, dx$, $f \in L^2(\Omega)$ and Ω is a domain in \mathbf{R}^d , d = 1, 2, 3.

The permeability a

Figure 1: The permeability *a* (in log scale).

Why multiscale method?

• If we for the moment assume a to be periodic $a = a(x/\epsilon)$ we have (Hou),

$$\|\nabla u - \nabla U\| \le C \frac{H}{\epsilon} \|f\|.$$

- H > \epsilon will give unreliable results even with exact quadrature.
- *H* < *\epsilon* will be too computationally expensive to solve on a single mesh.
- Parallelized local problems must be solved.

The variational multiscale method

Find $u_c \in V_c$ and $u_f \in V_f$, $V_c \oplus V_f = V$ such that,

$$a(u_c + u_f, v_c + v_f) = l(v_c + v_f),$$

for all $v_c \in V_c$ and $v_f \in V_f$.

$$a(u_c, v_c) + a(u_f, v_c) = l(v_c) \quad \text{for all } v_c \in V_c,$$

$$a(u_f, v_f) = (R(u_c), v_f) \quad \text{for all } v_f \in V_f.$$

where we introduce the residual distribution, $(R(u_c), v_f) = l(v_f) - a(u_c, v_f).$

The variational multiscale method

Figure 2: u_c , u_f , and $u_c + u_f$.

Approximation

We derive the method in two steps.

• We decouple the fine scale equations by introducing a partition of unity $\sum_{i \in \mathcal{N}} \varphi_i = 1$,

$$a(u_{f,i}, v_f) = (R(u_c), \varphi_i v_f)$$
 for all $v_f \in V_f$.

• For each $i \in \mathcal{N}$ we discretize V_f and solve the resulting problem on a patch ω_i rather then Ω ,

$$a(U_{f,i}, v_f) = (R(U_c), \varphi_i v_f)$$
 for all $v_f \in V_f^h(\omega_i)$.

To the right we see a mesh star to the left what we call a two layer mesh star. The coarse mesh size is denoted H and the fine mesh size is denoted h.

The new vms

۲

The resulting method reads: find $U_c \in V_c$ and $U_f = \sum_{i \in \mathcal{N}} U_{f,i}$ where $U_{f,i} \in V_f^h(\omega_i)$ such that

$$a(U_c, v_c) + a(U_f, v_c) = l(v_c),$$

$$a(U_{f,i}, v_f) = (R(U_c), \varphi_i v_f),$$

for all $v_c \in V_c$, $v_f \in V_f^h(\omega_i)$, and $i \in \mathcal{N}$.

The patch is chosen such that $supp(\varphi_i) \subset \omega_i \subset \Omega$.

The local solution $U_{f,i}$

The solution improves as the patch size increases.

Motivation of the method

Why do we expect the method to work?

- The right hand side of the fine scale equations has support on a coarse mesh star, $(R(U_c), \varphi_i v_f)$.
- The fine scale solution $U_{f,i} \in V_f^h(\omega_i)$ which is a slice space.

This makes $U_{f,i}$ decay rapidly, which makes it possible to get a good approximation using small patches.

How do we choose the patchsize and h?

Our aim is to create a method that tunes critical parameters by itself.

- A posteriori error estimation bounds the error from above in terms of known quantities.
- Based on this we formulate an adaptive algorithm.
- The algorithm tunes the critical parameters automatically.

Energy norm estimate, $||e||_a^2 = a(e, e)$

$$\begin{aligned} \|e\|_{a} &\leq \sum_{i \in \mathcal{C}} C_{i} \|H\mathcal{R}(U_{c})\|_{\omega_{i}} \\ &+ \sum_{i \in \mathcal{F}} C_{i} \left(\|\sqrt{H\Sigma}(U_{f,i})\|_{\partial \omega_{i}} + \|h\mathcal{R}_{i}(U_{f,i})\|_{\omega_{i}} \right) \end{aligned}$$

- The first term is the coarse scale mesh error.
- The second term is the error committed by restriction to patches $\Sigma(U_{f,i}) \approx \mathbf{n} \cdot a \nabla U_{f,i}$.
- The third term is the fine scale mesh error.

The local solution $U_{f,i}$

The term $\boldsymbol{n} \cdot a \nabla U_{f,i}$ decreases on the boundary $\partial \omega_i$ as the patch size increases.

Adaptive strategy

$$\begin{aligned} \|e\|_{a} &\leq \sum_{i \in \mathcal{C}} C_{i} \|H\mathcal{R}(U_{c})\|_{\omega_{i}} \\ &+ \sum_{i \in \mathcal{F}} C_{i} \left(\|\sqrt{H\Sigma}(U_{f,i})\|_{\partial \omega_{i}} + \|h\mathcal{R}_{i}(U_{f,i})\|_{\omega_{i}} \right) \end{aligned}$$

- We calculate these for each $i \in \{\text{coarse fine}\}$.
- Large values i ∈ coarse → more local problems.
- Large values $i \in fine \rightarrow more$ layers or smaller h.

Extension to a mixed setting

In Paper IV we have extended this theory to the mixed formulation of the Poisson equation,

$$\begin{cases} \frac{1}{a}\boldsymbol{\sigma} - \nabla u = 0 & \text{in } \Omega, \\ -\nabla \cdot \boldsymbol{\sigma} = f & \text{in } \Omega, \\ n \cdot \boldsymbol{\sigma} = 0 & \text{on } \Gamma. \end{cases}$$

We give error estimates in energy norm $\|\frac{1}{\sqrt{a}}(\boldsymbol{\sigma} - \boldsymbol{\Sigma})\|$ and for a linear functional $(\boldsymbol{\sigma} - \boldsymbol{\Sigma}, \omega).$

Numerical examples

Figure 3: 2D slice of the permeability *a* (in log scale) taken from the tenth SPE comparative so-lution project.

Reference solutions

Figure 4: Above we see the reference solution, (left) flux $-\Sigma$ and (right) pressure u.

Convergence

Figure 5: Max norm error (compared to reference solution) in log scale versus number of layers.

Adaptivity in multi-physics

Adaptivity in multi-physics

We seek the water concentration c that solves the system,

$$\begin{cases} \frac{1}{a}\boldsymbol{\sigma} - \nabla u = 0 & \text{in } \Omega, \\ -\nabla \cdot \boldsymbol{\sigma} = f & \text{in } \Omega, \\ \boldsymbol{n} \cdot \boldsymbol{\sigma} = 0 & \text{on } \Gamma, \end{cases}$$

$$\begin{aligned} \dot{c} + \nabla \cdot (\boldsymbol{\sigma} c) - \epsilon \Delta c &= g \quad \text{in } \Omega \times (0, T], \\ \boldsymbol{n} \cdot \nabla c &= 0 \quad \text{on } \Gamma, \\ c &= c_0 \quad \text{for } t = 0. \end{aligned}$$

Meshes

Figure 9: The mesh for the flow problem is denoted Q and the transport problem \mathcal{K} .

Adaptivity in multi-physics

Figure 10: The solution to the transport problem.

Error estimates based on duality

We introduce the dual problems:

$$\begin{aligned} -\dot{\phi} - \boldsymbol{\Sigma} \cdot \nabla \phi - \epsilon \Delta \phi &= \psi \quad \text{in } \Omega \times (0, T], \\ \boldsymbol{n} \cdot \nabla \phi &= 0 \quad \text{on } \Gamma, \\ \phi &= 0 \quad \text{for } t = T, \end{aligned}$$

$$\begin{cases} \frac{1}{a}\boldsymbol{\chi} - \nabla\eta = \int_0^T c\nabla\phi \,dx & \text{in }\Omega, \\ -\nabla\cdot\boldsymbol{\chi} = 0 & \text{in }\Omega, \\ \boldsymbol{n}\cdot\boldsymbol{\chi} = 0 & \text{on }\Gamma, \end{cases}$$

Error estimates based on duality

$$\begin{split} \int_0^T (e, \psi) \, dt &\leq \sum_{K \in \mathcal{K}} \int_0^T \rho_K(C) (\Delta t \| \dot{\phi} \|_K + h \| \nabla \phi \|_K) \, dt \\ &+ \sum_{K \in \mathcal{Q}} (\| \nabla U^* - \frac{1}{a} \mathbf{\Sigma} \|_K + h^{-1/2} \| [U^*] \|_{\partial K \setminus \Gamma}) \| \mathbf{\chi} \|_K \\ &+ \sum_{K \in \mathcal{Q}} h \| \nabla \cdot \mathbf{\Sigma} + f \|_K \| \nabla \eta \|_K, \end{split}$$

 $\rho_K(C) = \|\dot{C} + \nabla \cdot (\boldsymbol{\Sigma}C) - \epsilon \triangle C - g\|_K + h^{-1/2} \|\epsilon[\boldsymbol{n} \cdot \nabla C]\|_{\partial K}.$

Adaptive algorithm

- Calculate the solutions Σ and U to the flow problem on Q.
- Calculate the solution to the transport problem C on \mathcal{K} .
- Calculate an approximate solution to the dual transport problem Φ , given ψ , on \mathcal{K} .
- Calculate an approximation to $\int_0^T c \nabla \phi \, dx$ from C and Φ .
- Calculate the approximate solutions to the dual flow problem χ and η on the mesh Q.

Adaptive algorithm

Figure 11: Information flow between solvers and data base.

Adaptive algorithm

۲

Calculate error indicators,

$$\begin{cases} I_1^K = \int_0^T \rho_K(C) (\Delta t \| \dot{\phi} \|_K + h \| \nabla \phi \|_K) dt, \\ I_2^K = (\| \nabla U^* - \frac{1}{a} \Sigma \|_K + h^{-1/2} \| [U^*] \|_{\partial K \setminus \Gamma}) \| \boldsymbol{\chi} \|_K \\ + h \| \nabla \cdot \Sigma + f \|_K \| \nabla \eta \|_K. \end{cases}$$

- If $I_1 = \sum_{K \in \mathcal{K}} I_1^K$ and $I_2 = \sum_{K \in \mathcal{Q}} I_2^K$ ok stop.
- If $I_1 >> I_2$ refine \mathcal{K} , $I_2 >> I_1$ refine \mathcal{Q} , return.
- If non of these hold we refine both ${\cal K}$ and ${\cal Q}$ and return.

Error indicators

Figure 12: The error indicators I_1 and I_2 . We use 15 and 100 % refinement level.

Adaptive meshes

Extension to convection-diffusion

Ongoing research

Model problem:

$$\begin{aligned} -\nabla \cdot \epsilon \nabla u + b \cdot \nabla u &= f \quad \text{in } \Omega, \\ u &= 0 \quad \text{on } \Gamma. \end{aligned}$$

Weak form: Find $u \in V = H_0^1(\Omega)$ such that,

a(u,v) + b(u,v) = l(v) for all $v \in H_0^1(\Omega)$,

where $a(v, w) = \int_{\Omega} \epsilon \nabla v \cdot \nabla w \, dx$, $b(u, v) = \int_{\Omega} b \cdot \nabla u \, v \, dx$ and $l(v) = \int_{\Omega} fv \, dx$.

Multiscale method for this problem

The multiscale method reads: find $U_c \in V_c$ and $U_f = \sum_{i \in \mathcal{N}} U_{f,i}$ where $U_{f,i} \in V_f^h(\omega_i)$ such that,

$$a(U_c, v_c) + a(U_f, v_c) + b(U_c, v_c) + b(U_f, v_c) = l(v_c), a(U_{f,i}, v_f) + b(U_{f,i}, v_f) = (R(U_c), \varphi_i v_f),$$

for all $v_c \in V_c$, $v_f \in V_f^h(\omega_i)$, and $i \in \mathcal{N}$.

۲

Numerical example

Let $\epsilon = 0.01$, f is a big close to [0, 0], and $b = -[b_x, b_x]$ as in figure:

Numerical example

Figure 17: $U_{f,i}$ for different patches.

Convergence

۲

Figure 18: In this example h = 1/100 and H = 4h.

Comments and questions

- Study quadrature error since b will not be resolved on coarse meshes. This will help to determine h.
- Adaptivity should now create patches that are very influenced by b. The boundary error should be seen as a function on the boundary.
- Is it possible to do a better split V = V_c ⊕ V_f in this case?
- What happens when $\epsilon \to 0$?
